

TIWG

WHICH IS TWIG

It is a template creation engine to use with PHP

As you can imagine, it is responsible for providing a solution to the treatment of visual issues around an application developed in this language

WHAT BRINGS

Fast: Twig compiles templates to optimized regular PHP code. The overall cost compared to regular PHP code has been minimized.

Safe: Twig has a sandbox mode to evaluate unreliable template code. This allows you to use Twig as a template language for applications where users can modify the template layout.

Flexible: Twig is powered by flexible lexical and syntactic analyzers. This allows the developer to define their own custom tags and filters, and create their own DSL.

LEARNING

They're easy to understand to do once you get the point

Generate templates optimizing PHP code

We use template syntax

Installing Composer
